AFTERCARE

After Your Saline Removal

Saline lifts old pigment out with the scab, so the scab is doing the work. Keeping the area clean and completely dry is what makes it succeed.

YOUR LOGO

WHEN	WHAT'S NORMAL	DO	AVOID
Day 0 today	Redness, slight swelling and light weeping. The area may look raw or darker.	Blot gently with clean, dry gauze until weeping stops. Leave it uncovered unless I say otherwise.	Water, ointment, balm, makeup and touching the area.
Days 1–3 scab forms	A dry crust forms with pigment inside it. Mild tenderness.	Keep it completely dry. Wash around it carefully and shower with your face away from the water.	Sweating, workouts, swimming, steam, rain and any products on the area.
Days 4–10 keep it dry	The scab tightens, itches, then falls off on its own.	Stay dry until the scab has fallen off naturally, usually in 7–10 days.	Picking, scratching, or soaking the scab off. It pulls out pigment unevenly and can scar.
Weeks 2–4	Pink, shiny new skin. The old pigment looks lighter.	Once the scab is off, gentle cleanser and a fragrance-free moisturizer if I say so.	Sun, tanning, retinoids and acids on the area for 4 weeks.
Week 8+ next session	Lightening keeps showing as the skin matures.	SPF daily once healed. Book your next session at least 8 weeks out.	New permanent makeup or other removal on the area until I've checked it.

Keep it dry
No water on the area for 7–10 days.

Let it fall
The scab lifts the pigment. Don't pick.

Skip the balm
No ointment or creams while it scabs.

Be patient
At least 8 weeks between sessions.

CALL ME RIGHT AWAY IF YOU NOTICE

- Redness or warmth that spreads, or pus
- Fever, or red streaks spreading from the area
- A scab that turns soft, wet or yellow
- Pain or swelling that gets worse after 72 hours
