WHY ACRYLATE ALLERGY MATTERS

Gel, acrylic, dip and nail glue contain acrylates. An allergy can develop after years of safe use, usually when uncured product touches skin, and once it starts it is lifelong. It can also affect future dental work and medical devices. **Nail techs do not do acrylate patch tests:** patch testing is done by a dermatologist.

Screening questions

Question			Details: where, when, what happened
Ever reacted to gel, acrylic, dip or nail glue?	☐ Yes	☐ No	
Itching, redness or swelling after a past nail service?	☐ Yes	☐ No	
Reacted to dental work, dentures or lash glue?	☐ Yes	☐ No	
Diagnosed with an acrylate allergy by a dermatologist?	☐ Yes	☐ No

Reaction record

DATE NOTICED | LAST SERVICE · PRODUCT

SYMPTOMS ☐ Itching ☐ Redness ☐ Swelling ☐ Blisters ☐ Lifting ☐ Pain ☐ Dry, cracked skin

WHERE ☐ Nail folds ☐ Fingertips ☐ Eyelids · face ☐ Neck ☐ Other _____

ACTION TAKEN ☐ Product removed ☐ Referred to dermatologist ☐ Manufacturer · FDA notified

Plan going forward

☐ No acrylate services until cleared by a dermatologist

☐ Non-acrylate services only (natural nails, polish)

☐ HEMA-free option discussed (informed choice)

☐ Cleared; dermatologist note on file

HEMA-free is not allergy-proof. Other acrylates can still cause a reaction, so never promise a product is "hypoallergenic."

I've shared my allergy history honestly. I'll report any itching, redness or swelling, and call 911 for trouble breathing.
